

Prompt Engineering Report

Task 2: AI Content Marketing using UGC Ads

Future Interns — Prompt Engineering Track

Prepared By: Manish

Business Chosen: Manish Gentora Cafe, Erode

AI Tool Used: Claude AI

Repository: FUTURE_PE_02

Date: July 4, 2026

1. Objective

The objective of this task was to create a complete AI-generated UGC (User-Generated Content) style ad pack for a local business, using structured prompt engineering. The deliverable included authentic-sounding ad scripts, scroll-stopping hooks, problem-solution-CTA formatted ads, and platform-specific adaptations for Instagram, Facebook, and YouTube Shorts. This task builds practical skills in AI-driven content marketing, ad psychology, and prompt design for conversion-focused, platform-aware content.

2. Business Overview

The business selected for this task is Manish Gentora, a cafe located in Erode, chosen for continuity with Task 1. The goal of the ad content was to represent the cafe's key strengths — coffee quality, food, and atmosphere — through the lens of an authentic customer voice rather than polished brand messaging, matching current trends in UGC-style advertising across social platforms.

Key positioning goals for the ad content were to:

- Sound like a genuine customer, not a scripted advertisement
- Highlight distinct strengths of the business across separate scripts (coffee, vibe, food)
- Create hooks and formats optimized for short-form, scroll-heavy platforms
- Adapt tone and caption style appropriately for each social platform

3. Prompt Strategy

The prompting approach was divided into four stages, each targeting a distinct component of a UGC ad campaign: base ad scripts, attention-grabbing hooks, problem-solution-CTA formatted ads, and platform-specific adaptations. This staged approach mirrors how real UGC ad campaigns are typically built — starting with core message variations, then adapting them for distribution.

3.1 Structure Used

- Ad Scripts Prompt — generated 3 UGC-style scripts, each focused on a different selling point (coffee, vibe, food)
- Hooks Prompt — generated 5 scroll-stopping opening lines in 5 distinct styles
- Problem-Solution-CTA Prompt — generated 2 ads following a structured persuasion format
- Platform Adaptation Prompt — took one base script and reformatted it for 3 different social platforms

3.2 Prompting Principles Applied

- Explicitly requesting an authentic, casual, 'talking to camera' tone to avoid generic ad-speak
- Constraining each script to a single focal point (coffee, vibe, or food) to keep messaging clear
- Requesting distinct hook styles by name (curiosity, humor, bold claim, question, POV) to ensure variety rather than repetitive outputs
- Specifying platform norms (caption length, tone) directly in the prompt so outputs required no manual reformatting

4. Prompt Iterations

The ad scripts prompt was run in two passes: an initial prompt requesting 3 scripts, followed by a targeted follow-up prompt to ensure all three core selling points (coffee, vibe, food) were explicitly covered. This iterative refinement ensured full coverage of the business's key strengths rather than leaving it to chance in a single broad request.

4.1 Ad Scripts Prompt (Initial + Follow-up)

"Write 3 short UGC-style ad scripts for 'Manish Gentora', a cafe in Erode. Each script should sound authentic, like a real customer talking to camera (not a polished ad), be 15-20 seconds when spoken, and highlight one specific reason to visit. Keep the tone casual and relatable."

Follow-up: "Write 2 more short UGC-style ad scripts for Manish Gentora. Script 1 should focus on the coffee quality, Script 2 should focus on the cozy vibe/atmosphere."

4.2 Hooks Prompt

"Write 5 scroll-stopping opening hooks for a UGC-style video ad about Manish Gentora cafe in Erode. Each hook should be different in style — curiosity-based, relatable/funny, bold claim, question-based, and POV style. Keep each under 15 words."

4.3 Problem-Solution-CTA Prompt

"Write 2 short ad scripts for Manish Gentora cafe using a problem-solution-CTA structure: start with a relatable problem, introduce Manish Gentora as the solution, and end with a clear call to action. Keep each under 100 words."

4.4 Platform Adaptation Prompt

"Take this ad script [The Food script] and adapt it into 3 versions: Instagram Reels (casual, trendy caption), Facebook (slightly longer, community-focused caption), and YouTube Shorts (punchy, curiosity-driven caption)."

5. AI Outputs

5.1 Ad Scripts

Three scripts were generated, each centered on a distinct strength: the coffee quality, the cozy vibe, and the food quality. All three maintained a casual, first-person, talking-to-camera tone consistent with authentic UGC content.

5.2 Hooks

Five hooks were generated, each in a distinct style: a curiosity-based hook implying a hidden gem, a relatable/humorous work-from-home joke, a bold comparative claim against a larger city's cafes, a question-based hook, and a POV-style hook. The variety allows for A/B testing different emotional entry points.

5.3 Problem-Solution-CTA Ads

Two structured ads were generated, one addressing mediocre coffee experiences and one addressing the lack of good hangout spots in Erode. Both followed a clear problem → solution → CTA arc within a 100-word limit, suitable for short-form video voiceover or caption copy.

5.4 Platform Adaptations

The food-focused script was adapted into three platform-specific versions. The Instagram version used trendy, emoji-driven language with a short punchy caption and hashtags. The Facebook version used a longer, more conversational caption designed to encourage comments and community engagement. The YouTube Shorts version used a punchy, curiosity-driven caption suited to quick discovery browsing.

Full prompt and output text is documented in the prompts/ and outputs/ folders of this repository.

6. Challenges

- Ensuring the ad scripts sounded like genuine customer speech rather than marketing copy required explicit tone constraints, since default AI outputs tend toward polished, brand-voice language.
- Generating hooks with real stylistic variety needed each style to be explicitly named in the prompt, since an unconstrained request produced overlapping tones.
- Adapting a single script across three platforms required balancing consistent core messaging with platform-appropriate caption length and tone.

7. Learnings

- Explicitly naming the required tone ('talking to camera', 'casual', 'relatable') is critical for generating convincing UGC-style content, since default AI tone tends toward formal advertising language.
- Naming specific hook styles in the prompt produces meaningfully different outputs, whereas a generic 'write 5 hooks' request tends to produce repetitive variations.
- Platform-specific adaptation works best as a two-step process: generate one strong base script first, then adapt tone and caption style per platform, rather than generating all platform versions independently.
- A structured problem-solution-CTA format is effective for keeping short-form ad copy focused and action-oriented within a strict word limit.

8. Conclusion

This task demonstrated how prompt engineering can be used to produce a complete, platform-ready UGC ad content pack for a real-world local business. By breaking the deliverable into ad scripts, hooks, problem-solution-CTA ads, and platform adaptations, and applying explicit tone and structural constraints at each stage, the AI-generated content closely matched the authentic, conversion-focused style used in real UGC ad campaigns. This exercise strengthened practical skills in AI-driven content marketing, ad psychology, and prompt design applicable to future client and brand projects.
